Input

- Spectrogram and segmentation mask

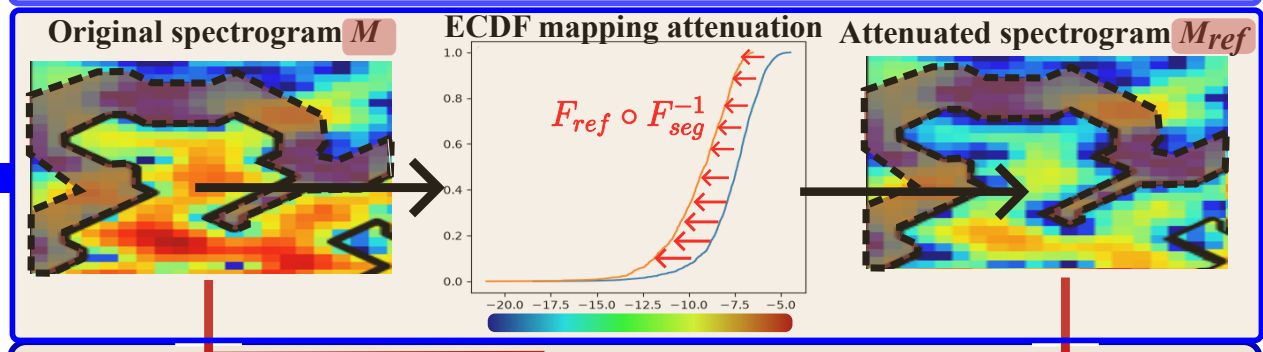

Step 1: Get reference of pixel intensities

- Dilate by N>1 pixels the segmentation mask
- Subtract dilated mask by original to get border ring
- Compute ECDF of pixels in reference ring and inside mask

Step 2: Attenuation to reference intensities

- Map intensities of segmented pixels to border ring ECDF

Step 3: Blending

- Weigthed sum blending of pixels inside mask and ECDF mapped ones

- α selection strategies:
  Fixed
  Spatial dependency

$$(1-\alpha).M + \alpha.M_{ref}$$

Blending coefficient α

Fixed in [0, 1]

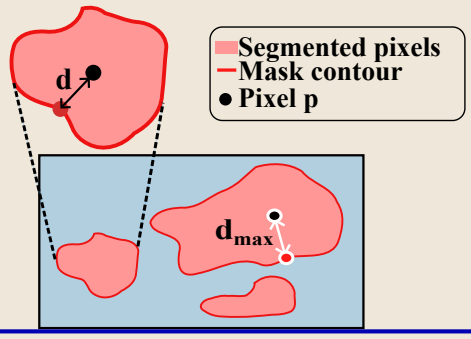

Spatial dependency: α(pixel)

$$\alpha(p) = \frac{d}{d_{max}}$$

picked pixel

pixel distance to contour

maximum distance

Output

- Pixel correction through blending with reference
