Input

- Spectrogram and segmentation mask

Step 1: Local reference extraction

- Dilate by N>1 pixels the segmentation mask
- Subtract dilated mask by original to get border ring
- Compute ECDF of pixels in reference ring and inside mask

Step 2: Mapping function

- Map intensities of segmented pixels to border ring CDF

Step 3: Blending improvment

- Weigthed sum between original and attenuated spectrograms

- α selection strategies:
  Fixed
  Spatial dependency

Output

- Pixel correction through blending with reference
